6.5. The Recursion Theorem

The recursion Theorem, due to Kleene, is a fundamental result in recursion theory.

Theorem 6.5.1 (Recursion Theorem, Version 1) Let $\varphi_0, \varphi_1, \ldots$ be any acceptable indexing of the partial recursive functions. For every total recursive function f, there is some n such that

 $\varphi_n = \varphi_{f(n)}.$

The recursion Theorem can be strengthened as follows:

Theorem 6.5.2 (Recursion Theorem, Version 2) Let $\varphi_0, \varphi_1, \ldots$ be any acceptable indexing of the partial recursive functions. There is a total recursive function h such that for all $x \in \mathbb{N}$, if φ_x is total, then

 $\varphi_{\varphi_x(h(x))} = \varphi_{h(x)}.$

A third version of the recursion Theorem is given below.

Theorem 6.5.3 (Recursion Theorem, Version 3) For all $n \ge 1$, there is a total recursive function h of n + 1 arguments, such that for all $x \in \mathbb{N}$, if φ_x is a total recursive function of n + 1 arguments, then

 $\varphi_{\varphi_x(h(x,x_1,\ldots,x_n),x_1,\ldots,x_n)} = \varphi_{h(x,x_1,\ldots,x_n)},$

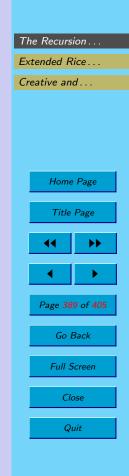

for all $x_1, \ldots, x_n \in \mathbb{N}$.

As a first application of the recursion theorem, we can show that there is an index n such that φ_n is the constant function with output n.

Loosely speaking, φ_n prints its own name. Let f be the recursive function such that

$$f(x,y) = x$$

for all $x, y \in \mathbb{N}$.

By the s-m-n Theorem, there is a recursive function g such that

$$\varphi_{g(x)}(y) = f(x, y) = x$$

for all $x, y \in \mathbb{N}$.

By the recursion Theorem 6.5.1, there is some n such that

 $\varphi_{g(n)} = \varphi_n,$

the constant function with value n.

As a second application, we get a very short proof of Rice's Theorem.

Let C be such that $P_C \neq \emptyset$ and $P_C \neq \mathbb{N}$, and let $j \in P_C$ and $k \in \mathbb{N} - P_C$.

Define the function f as follows:

$$f(x) = \begin{cases} j & \text{if } x \notin P_C, \\ k & \text{if } x \in P_C, \end{cases}$$

If P_C is recursive, then f is recursive. By the recursion Theorem 6.5.1, there is some n such that

 $\varphi_{f(n)} = \varphi_n.$

But then, we have

 $n \in P_C$ iff $f(n) \notin P_C$

by definition of f, and thus,

$$\varphi_{f(n)} \neq \varphi_n,$$

a contradiction.

Hence, P_C is not recursive.

As a third application, we have the following Lemma:

Lemma 6.5.4 Let C be a set of partial recursive functions and let

 $A = \{ x \in \mathbb{N} \mid \varphi_x \in C \}.$

The set A is not reducible to its complement \overline{A} .

The recursion Theorem can also be used to show that functions defined by recursive definitions other than primitive recursion are partial recursive.

This is the case for the function known as *Ackermann's function*, defined recursively as follows:

$$f(0, y) = y + 1,$$

$$f(x + 1, 0) = f(x, 1),$$

$$f(x + 1, y + 1) = f(x, f(x + 1, y))$$

It can be shown that this function is not primitive recursive. Intuitively, it outgrows all primitive recursive functions.

However, f is recursive, but this is not so obvious.

We can use the recursion Theorem to prove that f is recursive. Consider the following definition by cases:

$$g(n, 0, y) = y + 1,$$

$$g(n, x + 1, 0) = \varphi_{univ}(n, x, 1),$$

$$g(n, x + 1, y + 1) = \varphi_{univ}(n, x, \varphi_{univ}(n, x + 1, y)).$$

Clearly, g is partial recursive. By the s-m-n Theorem, there is a recursive function h such that

$$\varphi_{h(n)}(x,y) = g(n,x,y)$$

By the recursion Theorem, there is an m such that

$$\varphi_{h(m)} = \varphi_m$$

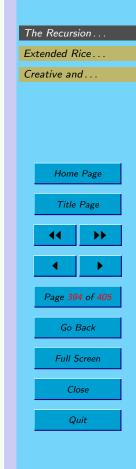

Therefore, the partial recursive function $\varphi_m(x, y)$ satisfies the definition of Ackermann's function.

We showed in a previous Section that $\varphi_m(x, y)$ is a total function, and thus, Ackermann's function is a total recursive function.

Hence, the recursion Theorem justifies the use of certain recursive definitions. However, note that there are some recursive definition that are only satisfied by the completely undefined function.

In the next Section, we prove the extended Rice Theorem.

6.6. Extended Rice Theorem

The extended Rice Theorem characterizes the sets of partial recursive functions C such that P_C is r.e.

First, we need to discuss a way of indexing the partial recursive functions that have a finite domain.

Using the uniform projection function Π , we define the primitive recursive function F such that

$$F(x, y) = \Pi(y + 1, \Pi_1(x) + 1, \Pi_2(x)).$$

We also define the sequence of partial functions P_0, P_1, \ldots as follows:

 $P_x(y) = \begin{cases} F(x,y) - 1 & \text{if } 0 < F(x,y) \text{ and } y < \Pi_1(x) + 1, \\ \text{undefined} & \text{otherwise.} \end{cases}$

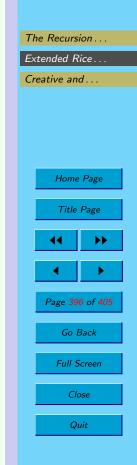

Lemma 6.6.1 Every P_x is a partial recursive function with finite domain, and every partial recursive function with finite domain is equal to some P_x .

The easy part of the extended Rice Theorem is the following lemma:

Recall that given any two partial functions $f: A \to B$ and $g: A \to B$, we say that g extends f iff $f \subseteq g$, which means that g(x) is defined whenever f(x) is defined, and if so, g(x) = f(x).

Lemma 6.6.2 Let C be a set of partial recursive functions. If there is an r.e. set A such that, $\varphi_x \in C$ iff there is some $y \in A$ such that φ_x extends P_y , then $P_C = \{x \mid \varphi_x \in C\}$ is r.e.

Proof. Lemma 6.6.2 can be restated as

$$P_C = \{ x \mid \exists y \in A, \, P_y \subseteq \varphi_x \}$$

If A is empty, so is P_C , and P_C is r.e.

Otherwise, let f be a recursive function such that

$$A = range(f).$$

Let ψ be the following partial recursive function:

$$\psi(z) = \begin{cases} \Pi_1(z) & \text{if } P_{f(\Pi_2(z))} \subseteq \varphi_{\Pi_1(z)}, \\ \text{undefined} & \text{otherwise.} \end{cases}$$

Extended F	Rice	
Creative an	d	
_		
Home Page		
Title Page		
••		
Page 397 of 405		
Go Back		
Full Screen		
Close		
Quit		

It is clear that

 $P_C = range(\psi).$

To see that ψ is partial recursive, write $\psi(z)$ as follows:

$$\psi(z) = \begin{cases} \Pi_1(z) & \text{if } \forall w \leq \Pi_1(f(\Pi_2(z))) \\ & [F(f(\Pi_2(z)), w) > 0 \supset \\ & \varphi_{\Pi_1(z)}(w) = F(f(\Pi_2(z)), w) - 1], \\ \text{undefined otherwise.} \end{cases}$$

To establish the converse of Lemma 6.6.2, we need two Lemmas.

Lemma 6.6.3 If P_C is r.e. and $\varphi \in C$, then there is some $P_y \subseteq \varphi$ such that $P_y \in C$.

As a corollary of Lemma 6.6.3, we note that TOTAL is not r.e.

Lemma 6.6.4 If P_C is r.e., $\varphi \in C$, and $\varphi \subseteq \psi$, where ψ is a partial recursive function, then $\psi \in C$.

Observe that Lemma 6.6.4 yields a new proof that TOTAL is not r.e. Finally, we can prove the extended Rice Theorem.

Theorem 6.6.5 (Extended Rice Theorem) The set P_C is r.e. iff there is an r.e. set A such that

 $\varphi_x \in C \quad iff \quad \exists y \in A \ (P_y \subseteq \varphi_x).$

Proof. Let $P_C = dom(\varphi_i)$. Using the s-m-n Theorem, there is a recursive function k such that

 $\varphi_{k(y)} = P_y$

for all $y \in \mathbb{N}$.

Define the r.e. set A such that

$$A = dom(\varphi_i \circ k).$$

Then,

$$y \in A$$
 iff $\varphi_i(k(y)) \downarrow$ iff $P_y \in C$.

Next, using Lemma 6.6.3 and Lemma 6.6.4, it is easy to see that

 $\varphi_x \in C \quad \text{iff} \quad \exists y \in A \, (P_y \subseteq \varphi_x).$

6.7. Creative and Productive Sets

In this section, we discuss some special sets that have important applications in logic: creative and productive sets.

The concepts to be described are illustrated by the following situation: Assume that

 $W_x \subseteq \overline{K}$

for some $x \in \mathbb{N}$.

We claim that

 $x \in \overline{K} - W_x.$

Indeed, if $x \in W_x$, then $\varphi_x(x)$ is defined, and by definition of K, we get $x \notin \overline{K}$, a contradiction.

Therefore, $\varphi_x(x)$ must be undefined, that is,

$$x \in \overline{K} - W_x$$

The above situation can be generalized as follows.

Definition 6.7.1 A set A is *productive* iff there is a total recursive function f such that

if $W_x \subseteq A$ then $f(x) \in A - W_x$

for all $x \in \mathbb{N}$. The function f is called the *productive function of* A. A set A is *creative* if it is r.e. and if its complement \overline{A} is productive.

As we just showed, K is creative and \overline{K} is productive. The following facts are immediate conequences of the definition:

(1) A productive set is not r.e.

(2) A creative set is not recursive.

Creative and productive sets arise in logic.

The set of theorems of a logical theory is often creative. For example, the set of theorems in Peano's arithmetic is creative. This yields incomplete-ness results.

Lemma 6.7.2 If a set A is productive, then it has an infinite r.e. subset.

Another important property of productive sets is the following:

Lemma 6.7.3 If a set A is productive, then $\overline{K} \leq A$.

Using Lemma 6.7.3, the following results can be shown:

Lemma 6.7.4 The following facts hold:

(1) If A is productive and $A \leq B$, then B is productive.

(2) A is creative iff A is equivalent to K.

(3) A is creative iff A is complete,
