Course Staff

• Steve Zdancewic (Instructor)
  – Web: www.cis.upenn.edu/~stevez
  – Office hours: Tues: 9:30 - 10:30 am, and by appointment
  – Office: Levine 511

• Jianzhou Zhao (TA)
  – Office hours: Weds. 3:00 – 4:00 pm
  – Office: Levine 565

• Send mail to:
  – cis551@seas.upenn.edu
  – Please include “CIS551” as part of your subject line!
Course Information

• Course Web Page:
  – [www.cis.upenn.edu/~cis551](http://www.cis.upenn.edu/~cis551)

• Textbook: none
  – Assigned reading: articles and web pages
  – Lecture slides will be available on the course web pages
  – Handouts and notes as appropriate
Prerequisites

- Would like to learn about computer and network security.

- Some programming experience
  - Java
  - C or C++ helpful (but not necessary - you can pick up what you need to know)

- Some computer networks experience
  - Do you know what a protocol stack is?
  - Do you generally understand TCP/IP?
  - TCOM 500

- Note: Undergraduates are welcome to take 551
Grading Criteria

• 16% Midterm I - tentative date: Feb. 17th
• 16% Midterm II - tentative date: April 2nd
• 25% Final exam
• 40% Course projects (group projects)
• 03% Course participation

• Policies:
  – No individual work on group projects
  – Only “reasonable” regrade requests permitted
  – See course web pages
A Warning: Do Not Cheat

• I expect students to follow the code of academic integrity

• This course reuses projects from previous years.
  – We keep all of the old solutions
  – We can tell if you’re copying

• If you’re feeling tempted to cheat, come see me instead
  – if you need more time for some reason
  – if your partners aren’t cooperating
Student Background…

1. How many of you have programmed in C or C++?
2. How many of you have programmed in Java?
3. How many of you have written shell scripts?
4. How many of you have never done any programming?
5. How many of you can explain how a buffer overflow exploit works?
6. Have any of you written a buffer overflow exploit?
7. How many of you can explain how TCP/IP works?
8. How many of you have set up a wireless network?
9. How many of you have had experienced a virus or worm attack on some computer you care about?
10. Have any of you written a virus or worm?
Student Background…

11. How many of you regularly use SSH or SFTP?
12. How many of you can explain how they work?
13. How many of you have run a packet sniffer or port scanner?
14. How many of you can define the term “Trusted Computing Base”?
15. How many of you have used a debugger?
16. How many of you are Masters students?
17. How many of you are PhD students?
18. How many of you are Undergraduates?
Course Topics

- Software Security / Malicious Code
  - Buffer overflows, viruses, worms, protection mechanisms
- System Security
  - Hacker behavior, intrusion & anomaly detection, hacker and admin tools
- Networks & Infrastructure
  - TCP/IP, Denial of Service, IPSEC, TLS/SSL
- Internet Security
  - Viruses, worms, spam, web security (XSS), phishing
- Basic Cryptography
  - Shared Key Crypto (AES/DES), Public Key Crypto (RSA)
- Crypto Software & Applications
  - Cryptographic libraries, authentication, digital signatures
- Covert Channels
Outline

• Try to answer the questions:
  – What is computer security?
  – What do we mean by a secure program?
• Historical context
  – Basic definitions & background
  – Examples of security
• General principles of secure design
• Focus on one widespread example:
  – Buffer overflows
Software Vulnerabilities

• Every day you read about new software vulnerabilities in the news
  – Buffer overflows
  – Cross-site scripting
  – Format-string vulnerabilities
  – Spam
  – Worms/Viruses
  – Phishing

• Check out www.cert.org for plenty of examples
Slashdot Security Headlines in 2009

• Employees the Next (Continuing) Big Security Risk?
• Researchers Hack Intel's VPro
• Data Breaches Rose Sharply In 2008
• Twitter Hack Details Revealed
• Another DNS Flaw Found, Patched
• Trojan Found At Torrent Sites Insists "Downloading Is Wrong"
• Storm Worm Botnet "Cracked Wide Open"
• Taxpayer Data At IRS Remains Vulnerable
• Biometric Passports Agreed To In EU
• GPUs Used To Crack WiFi Passwords Faster
CERT Incidents

![Graph showing the number of CERT incidents from 1986 to 2004. The x-axis represents the years, and the y-axis represents the number of incidents. The number of incidents increases significantly over the years.]
CERT Vulnerabilities

CERT Vulnerabilities Reported

Number of Vulnerabilities

1993 1995 1997 1999 2001 2003 2005 2007
What do we mean by security?

• What does it mean for a computer system to be secure?
• Comments generated from class discussion:
When is a program secure?

• When it does exactly what it should?
  – Not more.
  – Not less.

• But how do we know what a program is supposed to do?
  – Somebody tells us? (But do we trust them?)
  – We write the specification ourselves? (How do we verify that the program meets the specification?)
  – We write the code ourselves? (But what fraction of the software you use have you written?)
When is a program secure?

- 2nd try: A program is secure when it doesn’t do something it shouldn’t.

- Easier to specify a list of “bad” things:
  - Delete or corrupt important files
  - Crash my system
  - Send my password over the Internet
  - Send threatening e-mail to the president posing as me

- But… what if most of the time the program doesn’t do bad things, but occasionally it does? Is it secure?
When is a program secure?

• Claim: Perfect security does not exist.
  – Security vulnerabilities are the result of violating an assumption about the software (or, more generally the entire system).
  – Corollary: As long as you make assumptions, you’re vulnerable.
  – And: You always need to make assumptions!

• Example: Buffer overflows
  – Assumption (by programmer) is that the data will fit in the buffer.
  – This leads to a vulnerability: Supply data that is too big for the buffer (thereby violating the assumptions)
  – Vulnerabilities can be exploited by an attack.
When is a program secure enough?

• Security is all about tradeoffs
  – Performance
  – Cost
  – Usability
  – Functionality

• The right question is: how do you know when something is secure enough?
  – Still a hard question
  – Requires understanding of the tradeoffs involved

• Is Internet Explorer secure enough?
  – Depends on context
How to think about tradeoffs?

• What is it that you are trying to protect?
  – Music collection vs. nuclear missile design data

• How valuable is it?

• In what way is it valuable?
  – Information may be important only to one person (e.g. private e-mail or passwords)
  – Information may be important because it is accurate and reliable (e.g. bank’s accounting information)
  – A computer system may be important because of a service it provides (e.g. Google’s web servers)
Historical Context

- Assigned Reading: Saltzer & Schroeder 1975
  \textit{The Protection of Information in Computer Systems}
  - available from course web pages

- Unauthorized information release
  - Confidentiality

- Unauthorized information modification
  - Integrity

- Unauthorized denial of use
  - Availability

- What does “unauthorized” mean?
Example Security Techniques

- Labeling files with a list of authorized users
  - Access control (must check that the user is permitted on access)
- Verifying the identity of a prospective user by demanding a password
  - Authentication
- Shielding the computer to prevent interception and subsequent interpretation of electromagnetic radiation
  - Covert channels
- Enciphering information sent over telephone lines
  - Cryptography
- Locking the room containing the computer
  - Physical aspects of security
- Controlling who is allowed to make changes to a computer system (both its hardware and software)
  - Social aspects of security
Example Vulnerabilities

- 01/13/2009: RealFlex RealWin buffer overflow
- 12/31/2008: MD5 vulnerable to collision attacks
- 10/23/2008: Microsoft Server service RPC stack buffer overflow vulnerability
- 03/29/2007: Microsoft Windows animated cursor stack buffer overflow
- 07/11/2006: Microsoft DHCP Client service contains a buffer overflow
- ...

...
Case Study: Buffer Overflows

• First project: Due: 6 Feb. 2007 at 11:59 p.m.
• [http://www.cis.upenn.edu/~cis551/project1.html](http://www.cis.upenn.edu/~cis551/project1.html)

• Group project:
  – 2 or 3 students per group
  – Send e-mail to TA with your group by Jan. 25th

• Assigned Reading:
  Aleph One (1996)
  *Smashing the Stack for Fun and Profit*

• This is essentially a tutorial for the project
Next Time

- I will be out of town.
- Jianzhou Zhao will give an overflow of Project 1
- Buffer overflows
