- Many things are instead sold via posted prices.

Overview

- We've seen (if we know the valuation distributions) how to maximize social welfare and revenue with an auction.
- But auctions are difficult to run. They require e.g. all participants to be present and coordinating.
- Many things are instead sold via posted prices.
- This lecture: How to approximate the welfare and revenue of the optimal auction with posted prices

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

A Model:

 k recognizable types of buyers (based on demographics, purchase history, or anything else).

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

A Model:

- k recognizable types of buyers (based on demographics, purchase history, or anything else).
- Buyers of type *i* have valuation $v_i \sim D_i$, where D_i regular.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

A Model:

- k recognizable types of buyers (based on demographics, purchase history, or anything else).
- Buyers of type *i* have valuation $v_i \sim D_i$, where D_i regular.

Buyers arrive one at a time until the item is sold.

A Model:

- k recognizable types of buyers (based on demographics, purchase history, or anything else).
- Buyers of type *i* have valuation $v_i \sim D_i$, where D_i regular.
- Buyers arrive one at a time until the item is sold.
- ▶ Buyers of type *i* face price p_i. If v_i ≥ p_i they buy the item, and we get revenue p_i. Otherwise they pass.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

A Model:

- k recognizable types of buyers (based on demographics, purchase history, or anything else).
- Buyers of type *i* have valuation $v_i \sim D_i$, where D_i regular.
- Buyers arrive one at a time until the item is sold.
- ▶ Buyers of type *i* face price p_i. If v_i ≥ p_i they buy the item, and we get revenue p_i. Otherwise they pass.

Are there choices of p_i that allow us to approximate the welfare or revenue of the optimal auction?

Consider the following game:

▶ In each of *n* steps $i \in \{1, ..., n\}$, you are offered a prize $\pi_i \sim G_i$. (The distributions G_i are known in advance).

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Consider the following game:

- ▶ In each of *n* steps $i \in \{1, ..., n\}$, you are offered a prize $\pi_i \sim G_i$. (The distributions G_i are known in advance).
- At each step *i*, after seeing π_i, you can either choose to accept it and end the game or reject it and continue.

Consider the following game:

- ▶ In each of *n* steps $i \in \{1, ..., n\}$, you are offered a prize $\pi_i \sim G_i$. (The distributions G_i are known in advance).
- At each step *i*, after seeing π_i, you can either choose to accept it and end the game or reject it and continue.
- A prophet could forsee all of the prizes and make sure to always take the highest one. His expected profit would be:

 $Profit(Prophet) = \mathbb{E}[\max_{i} \pi_{i}]$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Consider the following game:

- In each of n steps i ∈ {1,..., n}, you are offered a prize π_i ~ G_i. (The distributions G_i are known in advance).
- At each step *i*, after seeing π_i, you can either choose to accept it and end the game or reject it and continue.
- A prophet could forsee all of the prizes and make sure to always take the highest one. His expected profit would be:

$$Profit(Prophet) = \mathbb{E}[\max_{i} \pi_{i}]$$

How well can you do?

Definition

A *threshold* strategy fixes some threshold t and accepts the first prize such that $\pi_i \ge t$.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Definition

A *threshold* strategy fixes some threshold t and accepts the first prize such that $\pi_i \ge t$.

An immediate connection to welfare: t corresponds to price p, accepting reward π_i corresponds to obtaining welfare v_i .

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Definition

A *threshold* strategy fixes some threshold t and accepts the first prize such that $\pi_i \ge t$.

An immediate connection to welfare: t corresponds to price p, accepting reward π_i corresponds to obtaining welfare v_i .

Theorem

For every set of distributions G_1, \ldots, G_n , there is a threshold strategy that guarantees reward at least $\frac{1}{2} \mathbb{E}[\max_i \pi_i]$.

Notation:
$$z^+ = max(z, 0)$$
, $V^* = max_i \pi_i$.

• Notation: $z^+ = max(z, 0)$, $V^* = max_i \pi_i$.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

• We'll use threshold $t = \frac{1}{2} E[V^*]$.

- Notation: $z^+ = max(z, 0)$, $V^* = max_i \pi_i$.
- We'll use threshold $t = \frac{1}{2} E[V^*]$.
- We'll use language of the economic application:
 - "item is unsold" "We don't accept any prizes"

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

"item is sold" "We accept a prize"

- Notation: $z^+ = max(z, 0)$, $V^* = max_i \pi_i$.
- We'll use threshold $t = \frac{1}{2} E[V^*]$.
- We'll use language of the economic application:
 - "item is unsold" "We don't accept any prizes"
 - "item is sold" "We accept a prize"
- We'll prove the prophet inequality by decomposing expected reward between:

- 1. Expected revenue, and
- 2. Expected buyer utility.

► To show: Expected welfare (reward) is large.

- ► To show: Expected welfare (reward) is large.
- Suppose we sell to buyer *i* at price *p* (select reward *i*):

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

- We obtain revenue p
- ► Buyer obtains utility v_i − p.

- ► To show: Expected welfare (reward) is large.
- Suppose we sell to buyer *i* at price *p* (select reward *i*):

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

- We obtain revenue p
- ► Buyer obtains utility v_i − p.
- Welfare = Revenue + Buyer Utility.

- ► To show: Expected welfare (reward) is large.
- Suppose we sell to buyer *i* at price *p* (select reward *i*):
 - We obtain revenue p
 - Buyer obtains utility v_i p.
- Welfare = Revenue + Buyer Utility.
- Strategy: Prove lower bounds on expected revenue and buyer utility separately.

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Expected Revenue:

 $E[\text{Revenue}] = p \cdot \Pr[\text{Item is sold}] = \frac{1}{2} E[V^*] \cdot \Pr[\text{Item is sold}]$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Expected Revenue:

 $E[Revenue] = p \cdot \Pr[Item \text{ is sold}] = \frac{1}{2}E[V^*] \cdot \Pr[Item \text{ is sold}]$

Buyer Utility:

Expected Revenue:

 $E[Revenue] = p \cdot \Pr[Item \text{ is sold}] = \frac{1}{2}E[V^*] \cdot \Pr[Item \text{ is sold}]$

Buyer Utility:

If we get to buyer *i* before selling the item, she has opportunity to buy. So her utility is (v_i − p)⁺.

Expected Revenue:

 $E[\text{Revenue}] = p \cdot \Pr[\text{Item is sold}] = \frac{1}{2} E[V^*] \cdot \Pr[\text{Item is sold}]$

Buyer Utility:

If we get to buyer *i* before selling the item, she has opportunity to buy. So her utility is (v_i − p)⁺.

So expected buyer utility is:

$$\mathbf{E}[\text{Utility}] = \sum_{i=1}^{n} \mathbf{E}[(v_i - p)^+] \cdot \Pr[\text{item is unsold before } i]$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のへで

Expected Revenue:

 $E[\text{Revenue}] = p \cdot \Pr[\text{Item is sold}] = \frac{1}{2} E[V^*] \cdot \Pr[\text{Item is sold}]$

Buyer Utility:

If we get to buyer *i* before selling the item, she has opportunity to buy. So her utility is (v_i − p)⁺.

So expected buyer utility is:

$$E[\text{Utility}] = \sum_{i=1}^{n} E[(v_i - p)^+] \cdot \Pr[\text{item is unsold before } i]$$
$$\geq \sum_{i=1}^{n} E[(v_i - p)^+] \cdot \Pr[\text{item is unsold}]$$

Expected Revenue:

 $E[\text{Revenue}] = p \cdot \Pr[\text{Item is sold}] = \frac{1}{2} E[V^*] \cdot \Pr[\text{Item is sold}]$

Buyer Utility:

If we get to buyer *i* before selling the item, she has opportunity to buy. So her utility is (v_i − p)⁺.

So expected buyer utility is:

$$E[\text{Utility}] = \sum_{i=1}^{n} E[(v_i - p)^+] \cdot \Pr[\text{item is unsold before } i]$$

$$\geq \sum_{i=1}^{n} E[(v_i - p)^+] \cdot \Pr[\text{item is unsold}]$$

$$\geq E[\max_i (v_i - p)^+] \cdot \Pr[\text{item is unsold}]$$

Expected Revenue:

 $E[\text{Revenue}] = p \cdot \Pr[\text{Item is sold}] = \frac{1}{2} E[V^*] \cdot \Pr[\text{Item is sold}]$

Buyer Utility:

If we get to buyer *i* before selling the item, she has opportunity to buy. So her utility is (v_i − p)⁺.

So expected buyer utility is:

$$E[\text{Utility}] = \sum_{i=1}^{n} E[(v_i - p)^+] \cdot \Pr[\text{item is unsold before } i]$$

$$\geq \sum_{i=1}^{n} E[(v_i - p)^+] \cdot \Pr[\text{item is unsold}]$$

$$\geq E[\max_i (v_i - p)^+] \cdot \Pr[\text{item is unsold}]$$

$$\geq (E[\max_i v_i] - p) \cdot \Pr[\text{item is unsold}]$$

Expected Revenue:

 $E[Revenue] = p \cdot \Pr[Item \text{ is sold}] = \frac{1}{2}E[V^*] \cdot \Pr[Item \text{ is sold}]$

Buyer Utility:

If we get to buyer i before selling the item, she has opportunity to buy. So her utility is (v_i − p)⁺.

So expected buyer utility is:

 $E[\text{Utility}] = \sum_{i=1}^{n} E[(v_i - p)^+] \cdot \Pr[\text{item is unsold before } i]$ $\geq \sum_{i=1}^{n} E[(v_i - p)^+] \cdot \Pr[\text{item is unsold}]$ $\geq E[\max_i (v_i - p)^+] \cdot \Pr[\text{item is unsold}]$ $\geq (E[\max_i v_i] - p) \cdot \Pr[\text{item is unsold}]$ $= \frac{1}{2} E[V^*] \cdot \Pr[\text{Item is unsold}]$

So we can bound expected welfare/reward...

E[Welfare] = E[Revenue] + E[Utility]

So we can bound expected welfare/reward...

$$\begin{split} \mathbf{E}[\text{Welfare}] &= \mathbf{E}[\text{Revenue}] + \mathbf{E}[\text{Utility}] \\ &\geq \frac{1}{2}\mathbf{E}[V^*] \cdot \mathsf{Pr}[\text{Item is sold}] + \frac{1}{2}\mathbf{E}[V^*] \cdot \mathsf{Pr}[\text{Item is unsold}] \end{split}$$

So we can bound expected welfare/reward...

$$\begin{split} \mathrm{E}[\mathrm{Welfare}] &= \mathrm{E}[\mathrm{Revenue}] + \mathrm{E}[\mathrm{Utility}] \\ &\geq \frac{1}{2}\mathrm{E}[V^*] \cdot \mathsf{Pr}[\mathrm{Item \ is \ sold}] + \frac{1}{2}\mathrm{E}[V^*] \cdot \mathsf{Pr}[\mathrm{Item \ is \ unsold}] \\ &= \frac{1}{2}\mathrm{E}[V^*] \cdot \left(\mathsf{Pr}[\mathrm{Item \ is \ sold}] + \mathsf{Pr}[\mathrm{Item \ is \ unsold}]\right) \end{split}$$

So we can bound expected welfare/reward...

$$\begin{split} \mathrm{E}[\mathrm{Welfare}] &= \mathrm{E}[\mathrm{Revenue}] + \mathrm{E}[\mathrm{Utility}] \\ &\geq \frac{1}{2}\mathrm{E}[V^*] \cdot \Pr[\mathrm{Item \ is \ sold}] + \frac{1}{2}\mathrm{E}[V^*] \cdot \Pr[\mathrm{Item \ is \ unsold}] \\ &= \frac{1}{2}\mathrm{E}[V^*] \cdot \left(\Pr[\mathrm{Item \ is \ sold}] + \Pr[\mathrm{Item \ is \ unsold}]\right) \\ &= \frac{1}{2}\mathrm{E}[V^*] \end{split}$$

Welfare

Immediate implications for welfare maximization!

▶ Using a *single* fixed price $p = \frac{1}{2} E[V^*]$, can obtain half the expected welfare of the VCG mechanism.
